

Question:

What are the minimum and maximum possible values of Glasgow Coma Score?

Answer Choices:

- A. Minimum = 3, Maximum = 15
- B. Minimum = 0, Maximum = 13
- C. Minimum = 0, Maximum = 15
- D. Minimum = 3, Maximum = 18

Reasoning + Answer:

<think>

To determine the minimum and maximum possible values of Glasgow Coma Score , we need to understand the components of the score . The Glasgow Coma Scale assesses a patient's level of consciousness by evaluating three components :

- 1 . Eye Opening (E): This is scored from 1 to 4 , where 1 indicates no response and 4 indicates spontaneous opening of the eyes .
- 2 . Verbal Response (V): This is scored from 1 to 5 , where 1 indicates no response and 5 indicates an oriented response .
- 3 . Motor Response (M): This is scored from 1 to 6 , where 1 indicates no response and 6 indicates a normal response .

To calculate the minimum possible score , we consider the worst possible outcomes for each component :

- * Eye Opening (E): 1 (no response)
- * Verbal Response (V): 1 (no response)
- * Motor Response (M): 1 (no response)

Sum ming up these values , the minimum possible score would be $1 + 1 + 1 = 3$.

To calculate the maximum possible score , we consider the best possible outcomes for each component :

- * Eye Opening (E): 4 (spontaneous opening)
- * Verbal Response (V): 5 (oriented response)
- * Motor Response (M): 6 (normal response)

Sum ming up these values , the maximum possible score would be $4 + 5 + 6 = 15$.

Therefore , the minimum and maximum possible values of Glasgow Coma Score are 3 and 15 , respectively .

</think>< answer > A . Minimum = 3 , Maximum = 15
