

Question:

A 50 years old patient presented to the skin OPD with erythematous scaly plaques over trunk and extremities for last 10 years. Lesions are occasionally itchy. There is history of remission and relapse with exacerbation during winters. Most likely diagnosis is?

Answer Choices:

- A. Lichen planus
- B. Psoriasis vulgaris
- C. Pityriasis rosea
- D. Seborrhic dermatitis

Reasoning + Answer:

<think>

The key features for this patient include long-term persistence , remissions and relapses , and seasonal exacerbation during winters .

- Lichen planus typically presents as purplish flat-topped papules on extremities .
- Psoriasis vulgaris can match symptoms , especially since it shows remissions and relapses with dry flaky skin patches that are often winter exacerbated .
- Pityriasis rosea , on the other hand , shows a herald patch and trunk rash that may not exhibit seasonal exacerbation .
- Seborrhic dermatitis also involves itchy , scaly , erythematous skin but is more likely to be seen in creases like the folds of the upper chest and groin .
