

Question:
Which of the following factors is associated with a decreased risk of Alzheimer's?
Answer Choices:

- A. Being African or Hispanic American
- B. A lower level of education
- C. Living in a city
- D. Being married
- E. Having a family history of Alzheimer's
- F. High intake of saturated fats
- G. Older age
- H. Eating fish
- I. Being a smoker
- J. Drinking alcohol regularly

Reasoning + Answer:

<think>

- We need to identify a factor associated with a decreased risk of Alzheimer's .

- Being African or Hispanic American , living in a city , having a family history of Alzheimer's , high intake of saturated fats , older age , and being a smoker are generally associated with increased risk or no significant change .

- Lower education level and drinking alcohol regularly do not have a clear consistent link to Alzheimer's risk .

- Being married and eating fish are potentially related to decreased risk . Research suggests that married individuals might have lower risk and that fish intake is linked to lower Alzheimer's risk due to omega - 3 fatty acids .

- The safest and most consistently studied positive lifestyle choice that has been associated with decreased risk of Alzheimer's is eating fish .
