

Question:

In research study, a mother and her infant are alone in a room. A stranger enters and the mother leaves the room. When the mother returns to the room, the infant begins to cry and initially continues to do so even after being picked up by the mother. Eventually the infant settles down and returns to playing, apparently happily, with the toys provided. Which attachment classification is most likely to be appropriate for this infant

Answer Choices:

- A. Anxious avoidant
- B. Disorganized
- C. Disoriented
- D. Ambivalent
- E. Dependent
- F. Attachment disorder
- G. Fearful avoidant
- H. Avoidant
- I. Anxious resistant
- J. Secure

Reasoning + Answer:

<think>

- If the mother leaves , the infant shows distress and continues to cry upon her return , it shows the infant is seeking proximity but not responding well upon reunion which is characteristic of anxious resistant infants .

- Other attachment classifications don 't match the pattern of behaviour described .

- No shred of evidence shows dis orientation , dis organized attachment , attachment disorder , dependence , or fear avoidance as mentioned in other choices .

</think>

<answer>

I. Anxious resistant

</answer>
