

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<think>

Wendi starts the day by giving her flock $20 \text{ chickens} \times 15 \text{ cups of feed} / 3 \text{ meals} = 100 \text{ cups of feed}$.

She gives the flock another $20 \text{ chickens} \times 25 \text{ cups of feed} / 3 \text{ meals} = 166 \text{ cups of feed}$.

She still needs to give the flock $100 \text{ cups of feed} + 166 \text{ cups of feed} \hat{=} 100 \text{ cups of feed} = 166 \text{ cups of feed}$ for the final meal of the day.

</think>

<answer>

166

</answer>
