

Question:

James decides to run 3 sprints 3 times a week. He runs 60 meters each sprint. How many total meters does he run a week?

Reasoning + Answer:

<think> Okay , James runs 3 sprints 3 times a week , that means he runs a total of $3 \times 3 = 9$ sprints in a week . Each sprint is 60 meters , so to find the total distance , I need to multiply the total number of sprints by the distance of each sprint , which is $9 * 60 = 540$ meters </think><answer>540</answer>
