

Question:

Kylar went to the store to buy glasses for his new apartment. One glass costs \$5, but every second glass costs only 60% of the price. Kylar wants to buy 16 glasses. How much does he need to pay for them?

Reasoning + Answer:

<think> Okay , so Kylar wants to buy 16 glasses , and for the first 8 glasses , the cost will be $8 * \$5 = \40 . For the remaining 8 glasses , each costs 60 % of \$ 5 , which is $\$5 * 0.6 = \3 . So , the cost for the 8 glasses will be $8 * \$3 = \24 . Adding both amounts together , $\$40 + \$24 = \$64$. So , Kylar will need to pay \$ 64 for the glasses .</think><answer> 64 </answer>
