

Question:

Kylar went to the store to buy glasses for his new apartment. One glass costs \$5, but every second glass costs only 60% of the price. Kylar wants to buy 16 glasses. How much does he need to pay for them?

Reasoning + Answer:

<think> Okay , if one glass costs \$ 5 , then every second glass will cost 60 % of that , which is $\$5 * 0.60 = \3 . If Kylar wants to buy 16 glasses , that's 8 glasses at \$ 3 each , since they come in pairs . So , the cost of the 8 glasses is $8 * \$3 = \24 . Now , let's add the cost of the 8 single glasses , which is \$ 5 . The total cost will be $\$24 + \$5 = \$29$. </think><answer>29</answer>
