

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<think>
Wendi gives 15 cups of feed in the morning and 25 cups of feed in the afternoon for a total of $15 + 25 = 40$ cups of feed .
She has a flock of 20 chickens that eat 3 cups of food per meal so that is $3 * 20 = 60$ cups of feed needed for the entire flock .
By the afternoon , she has given 40 cups of food to the chickens for the morning and the afternoon meal so she needs $60 - 40 = 20$ cups of feed for the final meal of the day .
</think>
<answer>
20
</answer>
