

Question:

Kylar went to the store to buy glasses for his new apartment. One glass costs \$5, but every second glass costs only 60% of the price. Kylar wants to buy 16 glasses. How much does he need to pay for them?

Reasoning + Answer:

<think>
At the store, one glass will cost \$5, and the second glass costs only 60%, so the cost will be $5 * (1, .60) = \$3$.
Kylar will buy 16 glasses, and the second glass will cost only 60% of the price, so the total cost for all the glasses will be $(16 - 1) * 3 + 5 = \$55$
</think>
<answer>
55
</answer>
