

Question:

Kylar went to the store to buy glasses for his new apartment. One glass costs \$5, but every second glass costs only 60% of the price. Kylar wants to buy 16 glasses. How much does he need to pay for them?

Reasoning + Answer:

<think>

If one glass costs \$ 5 , that's 5 dollars .

Every second glass costs 60 % of 5 , which is 3 dollars .

16 glasses will have 8 glasses at the original price and 8 glasses at 3 dollars .

8 glasses at 5 dollars will cost $8 * 5 = 40$ dollars .

8 glasses at 3 dollars will cost $8 * 3 = 24$ dollars .

Total cost will be the sum of these , which is $40 + 24 = 64$ dollars .

</think>< answer > 64 </answer>
