

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<think> Okay , Wendi feeds 15 cups of feed to the chickens in the morning , and 25 cups in the afternoon , so the total feed so far is $15 + 25 = 40$ cups . Since each chicken needs 3 cups of feed , I can find out how many cups of feed the whole flock needs by multiplying the number of chickens by the cups per chicken , which is $20 \text{ chickens} * 3 \text{ cups} = 60 \text{ cups}$. Since Wendi has already given the flock 40 cups of feed , I need to find out how many more cups she needs for the final meal by subtracting 40 from 60 , which is $60 - 40 = 20$ cups . So , the number of cups of feed Wendi needs to give in the final meal is 20 .</think><answer>20</answer>
