

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<think> So if Wendi feeds 15 cups of feed to the chickens in the morning , and 25 cups of feed in the afternoon , the total feed given so far is $15 + 25 = 40$ cups . Since each chicken needs 3 cups of feed per day , and Wendi has 20 chickens , the total cups of feed the chickens will need for the day is $20 * 3 = 60$ cups . To find out how much Wendi needs for the final meal , I will subtract the total feed already given from the total feed the chickens need , which is $60 - 40 = 20$ cups </think><answer> 20 </answer>
