

Question:

Kylar went to the store to buy glasses for his new apartment. One glass costs \$5, but every second glass costs only 60% of the price. Kylar wants to buy 16 glasses. How much does he need to pay for them?

Reasoning + Answer:

<think> So if one glass costs \$ 5 , every second glass costs 60 % of \$ 5 , which is $0.6 * 5 = \$ 3$. If Kylar wants to buy 16 glasses , 8 of them will cost \$ 5 each and 8 of them will cost \$ 3 each . The total cost for the glasses that cost \$ 5 each is $8 * 5 = \$ 40$, and the total cost for the glasses that cost \$ 3 each is $8 * 3 = \$ 24$. The total amount Kylar needs to pay is the sum of these two , which is $40 + 24 = \$ 64$ </think>
><answer> 64 </answer>
