

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<think>
At breakfast, Wendi feeds her flock 20 chickens 15 cups of feed, so $20 \times 15 = 300$ cups of feed at the morning meal.
At lunch time, Wendi feeds her flock 20 chickens another 25 cups of feed, so $20 \times 25 = 500$ cups of feed.
Wendi's total feed is 300 cups from morning, plus 500 cups of feed at lunch time, for a total of $300 + 500 = 800$ cups of feed
Wendi feeds her flock 800 cups of feed in the morning and the afternoon meals, so in the final meal of the day she will give them $800 - 300 = 500$ cups of feed
</think>
<answer>
500
</answer>
