

Question:

Carla is downloading a 200 GB file. Normally she can download 2 GB/minute, but 40% of the way through the download, Windows forces a restart to install updates, which takes 20 minutes. Then Carla has to restart the download from the beginning. How long does it take to download the file?

Reasoning + Answer:

<think>

First find the size of the file that Carla can download before the computer restarts : $200\text{ GB} \times .4 = 80\text{ GB}$

Then divide that amount by Carla's download speed : $80\text{ GB} / 2\text{ GB / minute} = 40\text{ minutes}$

Then find the total time the second part of the download takes : $200\text{ GB} / 2\text{ GB / minute} = 100\text{ minutes}$

Then add the time of the first and second parts of the download to find the total time : $40\text{ minutes} + 100\text{ minutes} + 20\text{ minutes} = 160\text{ minutes}$

</think>

<answer>

160

</answer>
