

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<think>

Thus far in the day , Wendi has fed her chickens 15 cups + 25 cups = 40 cups of chicken feed .

Therefore , for the final meal of the day , she needs to feed her 20 chickens 40 cups / 3 meals = 13 . 33 cups per chicken .

Thus , Wendi needs to give her chickens 13 . 33 * 20 = 266 . 60 cups of feed .

For the sake of the chickens , she will need to round up to the nearest whole cup , meaning she needs to give her chickens 267 cups of chicken feed in the final meal of the day .

</think>

<answer>

267

</answer>
