

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<think>

Thus far , Wendi has given her chickens $15 + 25 = 40$ cups of feed .

Since she feeds each chicken three cups of feed per meal , she has already fed each chicken $40 / 3 = 13$ and $1 / 3$ cups of feed .

Therefore , to complete the three meals per day , she must feed each chicken an additional $3 - 13$ and $1 / 3 = -10$ and $1 / 3$ cups of feed .

Since a chicken cannot be fed a negative amount of feed , for the final meal of the day , Wendi will need to feed each chicken an additional 10 and $1 / 3$ cups of feed .

For the entire flock of 20 chickens , she will need to feed them $20 * 10$ and $1 / 3 = 200$ and $2 / 3$ cups of feed .

Thus , for the final meal of the day , Wendi will need to give her chickens 200 and $2 / 3$ cups of feed .

</think>

<answer>

200

</answer>
