

Question:

Kylar went to the store to buy glasses for his new apartment. One glass costs \$5, but every second glass costs only 60% of the price. Kylar wants to buy 16 glasses. How much does he need to pay for them?

Reasoning + Answer:

<think>
One glass costs $5 * 60 / 100 = \$3$.
Every second glass is cheaper, so it will cost $16 / 2 = \$8$ less.
Kylar will need to pay for 16 glasses $5 * 8 = \$40$ less.
In total Kylar will need to pay $16 * 5 = \$80$.
So Kylar will be able to pay $80 - 40 = \$40$ more for the glasses.
</think>
<answer>
40
</answer>
