

Question:

Carla is downloading a 200 GB file. Normally she can download 2 GB/minute, but 40% of the way through the download, Windows forces a restart to install updates, which takes 20 minutes. Then Carla has to restart the download from the beginning. How long does it take to download the file?

Reasoning + Answer:

<think>
First find the amount of data downloaded before the restart : $200 \text{ GB} \times 40\% = 80 \text{ GB}$
Then find the time Carla spends downloading that amount of data : $80 \text{ GB} / 2 \text{ GB / minute} = 40 \text{ minutes}$
Then find the total time the download takes by adding the time for the restart : $40 \text{ minutes} + 20$
 $\text{minutes} = 60 \text{ minutes}$
Then divide the total time by the amount of data downloaded to find the load per hour : $60 \text{ minutes} /$
 $200 \text{ GB} = .3 \text{ GB / minute}$
</think>
<answer>
3
</answer>
