

Question:

Kylar went to the store to buy glasses for his new apartment. One glass costs \$5, but every second glass costs only 60% of the price. Kylar wants to buy 16 glasses. How much does he need to pay for them?

Reasoning + Answer:

<think>
One cheaper glass costs $5 * 60 / 100 = \$3$.
So every pair of one normal and one cheaper glass costs $5 + 3 = \$8$.
Kylar needs $16 / 2 = 8$ such pairs.
That means he needs to pay $8 * 8 = \$64$ for them.
</think>
<answer>
64
</answer>
