

Question:

Kylar went to the store to buy glasses for his new apartment. One glass costs \$5, but every second glass costs only 60% of the price. Kylar wants to buy 16 glasses. How much does he need to pay for them?

Reasoning + Answer:

<think>
One glass costs $5 * 60 / 100 = \$3$.
So every second glass costs only $5 - 3 = \$2$.
Kylar needs to buy 8 such glasses, so he will need to pay $8 * 2 = \$16$.
The rest of the glasses, which means $16 - 8 = 8$ pieces, have a regular price.
So in total Kylar needs to pay $8 * 5 + 8 * 2 = \$76$.
</think>
<answer>
76
</answer>
