

Question:

Kylar went to the store to buy glasses for his new apartment. One glass costs \$5, but every second glass costs only 60% of the price. Kylar wants to buy 16 glasses. How much does he need to pay for them?

Reasoning + Answer:

<think>
The second glass costs $5 * 60\% = \$3$.
There are $16 / 2 = 8$ glasses of each kind.
Kylar pays $8 * 5 = \$40$ for the first glass.
He pays $3 * 8 = \$24$ for the second glass.
So he pays $40 + 24 = \$64$ for all of the glasses.
</think>
<answer>
64
</answer>
