

Question:

Kylar went to the store to buy glasses for his new apartment. One glass costs \$5, but every second glass costs only 60% of the price. Kylar wants to buy 16 glasses. How much does he need to pay for them?

Reasoning + Answer:

`<think>`
Kylar can split the glasses into two groups : the ones that cost \$5 and the ones that cost $\$5 * 60\% = \3 . So , one half of the glass costs $\$5 + \$3 = \$8$. That means one pair of glasses costs $\$8 \times 2 = \16 . Since Kylar wants 16 glasses , he needs to pay $\$16 \times 8 = \128 .
`</think>`
`<answer>`
128
