

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<think> <think>the total feed given in the morning and afternoon is <think>15 </think>+ <think>25 </think>= <think>40 </think> <think>now from the information in the problem , we know that each of her 20 chickens receive 3 cups of feed , so with the total amount of feed in the morning and afternoon feedings , the total feedings that are left to be done for her flock is $20 * 3 - 40 =$ <think>60 </think>- <think>40 </think>= <think>20 </think> <think>so the final feed Wendi needs to give the chickens should be 3 cups per chicken . </think> </think> <answer>60 </answer> </think> <answer>30 </answer> </think>
