

Question:

Kylar went to the store to buy glasses for his new apartment. One glass costs \$5, but every second glass costs only 60% of the price. Kylar wants to buy 16 glasses. How much does he need to pay for them?

Reasoning + Answer:

<think>Kylar needs to buy 16 glasses, but every second glass is at 60% of the regular price, which means, he buys 8 glasses at a discounted price and 8 glasses at full price. The first 8 glasses have a price of <think> $8 * 5 = 40$ </think>. The 2nd 8 glasses have a price of <think> $8 * 0.6 * 5 = 24$ </think>. Therefore, the total price for 16 glasses is <think> $40 + 24 = 64$ </think>. </think><answer>64</answer>
