

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<think>

In the morning , Wendi gives her chickens 15 cups of feed , and in the afternoon , she gives another 25 cups of feed , for a total of $15 + 25 = 40$ cups of feed

Each chicken is given 3 cups of feed per day , and there are 20 chickens , so the total amount of feed given per day is $20 * 3 = 60$ cups of feed

Wendi has already given her chickens 40 cups of feed in the morning and afternoon , so in the final meal she needs to give them $60 - 40 = 20$ cups of feed

</think>

<answer>

20

</answer>
