

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

`<think>`

There are 3 meals of feed given throughout the day so multiply 3 * 20 chickens to find the total amount of feed needed 20 chickens * 3 meals = 60 cups of feed

She has already fed 15 cups of feed in the morning + 25 cups of feed in the afternoon = 40 cups of feed given in morning and afternoon

Finally she needs to give 60 total cups of feed - 40 cups of feed already given = 20 cups of feed for the final meal of the day

`</think>`

`<answer>`

20

`</answer>`
