

Question:

Josh decides to try flipping a house. He buys a house for \$80,000 and then puts in \$50,000 in repairs. This increased the value of the house by 150%. How much profit did he make?

Reasoning + Answer:

<think>

We can find out the original value of the house and the increased value, then by the given formula about original value and profit.

If the original value of the house was 80,000\$, in 150% increase, the increased value of the house would be $150/100 * 80,000 = 120,000$ \$.

In addition to the original price of the house, Josh also spent 50,000 on repairs, so the overall price of the house he bought (including repairs) is $80,000 + 120,000 + 50,000 = 250,000$ \$.

The profit he made would be the difference between the increased overall house price and the cost he made to buy and repair it, that is $250,000 - 250,000 = 0$.
