

Question:

Josh decides to try flipping a house. He buys a house for \$80,000 and then puts in \$50,000 in repairs. This increased the value of the house by 150%. How much profit did he make?

Reasoning + Answer:

<think>

He added \$50,000 in repairs to the \$80,000 which makes the total price \$130,000. The value increases by 150% of the original price, so it's 150% of \$80,000 which equals to <think>(150/100)*80000=120000</think>. The total value after renovation becomes the original price + 120000, so it's <think>80000+120000=200000</think>. Thus, the profit can be calculated by subtracting the total cost (130000) from the final value (200000), resulting in <think>200000-130000=70000</think>.

</think>

<answer>70000</answer>
