

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<think>

In the morning , Wendi gives her 20 chickens 15 cups each in their feed , so she gives $15 * 20 = 300$ cups .

In the afternoon , Wendi gives the same flock 25 cups each , so she gives $25 * 20 = 500$ cups .

So in the morning and afternoon , Wendi gives $300 + 500 = 800$ cups .

Therefore , to compensate for the total feed for the entire day and accommodate the size of her flock , she gives $800 +$ feed in the final meal , thus needs $800 + 3 * 20 = 800 + 60 = 860$ cups

</think>

<answer>

860 cups </answer>
