

Question:

Josh decides to try flipping a house. He buys a house for \$80,000 and then puts in \$50,000 in repairs. This increased the value of the house by 150%. How much profit did he make?

Reasoning + Answer:

<think>The house's initial value is <think>80000</think>. By doing that he then multiplies the value of the house by <think>1.15</think>. So, the new value will be <think>80000*1.15=94000</think>. He invests another 50000 in repairs which the problem didn't say did anything, so the cost doesn't increase the value of the house, it's just money spent. The profit Josh gets is the sale value of <think>94000</think> minus the cost of 80000 + 50000 which gives 194000. </think>
><answer>19400</answer></answer>
