

Question:

Kylar went to the store to buy glasses for his new apartment. One glass costs \$5, but every second glass costs only 60% of the price. Kylar wants to buy 16 glasses. How much does he need to pay for them?

Reasoning + Answer:

```
<think>
The second glass costs  $5 * 60\% = \$3$ .
There are  $16 / 2 = 8$  glasses of each kind.
Kylar pays  $8 * 5 = \$40$  for the first glass.
He pays  $3 * 8 = \$24$  for the second glass.
So he pays  $40 + 24 = \$64$  for all of the glasses.
</think>
<answer>
64
</answer>
```
