

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<think>
In the morning, Wendi gives her 20 chickens 15 cups of feed, or a total of $20 \times 15 = 300$ cups of feed
In the afternoon, she gives her 20 chickens 25 cups of feed, or a total of $20 \times 25 = 500$ cups of feed
This means in the first two meals, she feeds a total of $300 + 500 = 800$ cups of feed
In total, she feeds her flock 800 cups of feed a day.
Since each chicken meal contains 3 cups of feed, then there are $800 / 3 = 266.66$ recurring cups of feed left for her final meal in the day
</think>
<answer>
266.66
</answer>
