

Question:

Kylar went to the store to buy glasses for his new apartment. One glass costs \$5, but every second glass costs only 60% of the price. Kylar wants to buy 16 glasses. How much does he need to pay for them?

Reasoning + Answer:

<think>
For the first glass , he needs to pay \$ 5 , and for the second glass , he needs to pay only $60 / 100 * 5 =$
\$ 3 .
So for two glasses , the cost is $5 + 3 =$ \$ 8 .
Kylar bought 16 glasses so to calculate how many pairs of two glasses he bought we perform $16 / 2 =$
8 .
So in those 8 pairs of glasses , he pay $8 * 8 =$ \$ 64 .
</think>
< answer >
64
</answer>
