

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<think>
The size of Wendi's flock of chicken is 20. She feeds each of her chicken in her flock 3 cups of chicken feed.
Wendi gives 15 cups of feed in the morning to her chickens and 25 cups in the afternoon.
She gives each chicken, 2 cups chicken feed twice in a day
The total number of cups of feed given to the flock in a day is $(2 * 20) = 40$.
Wendi needs 40 cups of chicken feed less the 40 cups she feeds her flock in a day in the final meal of the day which is 75 cups.
</think>
<answer>
75
</answer>
