

Question:

Kylar went to the store to buy glasses for his new apartment. One glass costs \$5, but every second glass costs only 60% of the price. Kylar wants to buy 16 glasses. How much does he need to pay for them?

Reasoning + Answer:

<think>
he paid $5 * 1 = 5$
the second glass costs $5 * 0.6 = 3$
he bought $16 / 2 = 8$ glasses for 5
he bought $16 / 2 = 8$ glasses for 3
so he paid $5 * 8 = 40$
and $3 * 8 = 24$
so he paid $40 + 24 = 64$
he paid 64
so he paid 64
</think>< answer> 64 </answer>
