

Question:

A robe takes 2 bolts of blue fiber and half that much white fiber. How many bolts in total does it take?

Reasoning + Answer:

<think>

To find out the total number of bolts of fiber required , first , I need to calculate the number of white bolts needed . Since the blue bolts needed are twice the number of white bolts , I can denote the number of white bolts as ' x '.

The number of blue bolts is given as $2x$. Now , the total number of bolts required is the sum of blue bolts and white bolts , which is $x + 2x = 3x$.

To find the total number of bolts , I need to know the value of ' x '. However , the question does not specify the value of ' x ', which means I need to find a general expression for the total number of bolts in terms of ' x '.

Since the problem asks for a numerical answer , I need to clarify that the question is asking for a specific number of bolts . To find this specific number , I would need more information about the value of ' x '. However , if I were to assume a specific value for ' x ', say 1 , I can calculate the total number of bolts .

Let's assume ' $x = 1$ '. Then , the number of blue bolts is $2 * 1 = 2$, and the number of white bolts is 1 . So , the total number of bolts required would be $2 + 1 = 3$.

</think><answer> 3 </answer>
