

Question:

James decides to run 3 sprints 3 times a week. He runs 60 meters each sprint. How many total meters does he run a week?

Reasoning + Answer:

<think>To start, I need to find out how many meters James runs in a single week. He runs 3 sprints each time, and he runs 3 times per week.

First, I'll find out the number of meters he runs in a week for one run, i.e., one week's worth of sprints.

I do this by multiplying the number of sprints he does per run by the number of runs he does each week:

$$3 \text{ sprints} * 3 \text{ runs / week} = 9 \text{ sprints / week}.$$

Then, to find out how many meters he runs in a week, I multiply the number of sprints he runs per week by the length of one sprint:

$$9 \text{ sprints} * 60 \text{ meters/s print} = 540 \text{ meters}.$$

So, James runs a total of 540 meters in a week. </think>

<answer> 540 meters </answer>
