

Question:

James decides to run 3 sprints 3 times a week. He runs 60 meters each sprint. How many total meters does he run a week?

Reasoning + Answer:

<thinking process >

Step 1 : We know that James runs 3 sprints each week .

Step 2 : Each sprint is 60 meters long .

So , the distance he runs per week = number of sprints per week $\times$ distance per sprint

Step 3 : Plug in the values : 3 sprints $\times$ 60 meters = 180 meters .

Therefore , James runs 180 meters a week .

</thinking process >

< answer > 180 </answer >
