

Question:
Two trains leave San Rafael at the same time. They begin traveling westward, both traveling for 80 miles. The next day, they travel northwards, covering 150 miles. What's the distance covered by each train in the two days?

Reasoning + Answer:

<thinking process >

Step 1 : Understand the problem .

We are given that two trains leave San Rafael at the same time , travel west ward for 8 0 miles each , and then the next day travel north ward for 1 5 0 miles each .

We are asked to find the total distance covered by each train over the two days .

Step 2 : Distance covered on first day (west ward)

Each train travels 8 0 miles west ward .

Step 3 : Distance covered on second day (north ward)

Each train travels 1 5 0 miles north ward .

Step 4 : Total distance covered = Distance on first day + Distance on second day

Total distance = 8 0 miles + 1 5 0 miles = 2 3 0 miles

Step 5 : Since both trains are identical in travel (same paths and distances), each train covers the same distance : 2 3 0 miles .

Final answer : 2 3 0 miles

</thinking process >

< answer > 2 3 0 miles </answer >
