

Question:
A robe takes 2 bolts of blue fiber and half that much white fiber. How many bolts in total does it take?

Reasoning + Answer:

Let's break down the problem step by step .

1 . ** Identify the amount of blue fiber needed : **

- The problem states that the robe takes 2 bolts of blue fiber .

2 . ** Determine the amount of white fiber needed : **

- The problem also states that the robe takes half as much white fiber as blue fiber .

- Since the blue fiber is 2 bolts , half of that would be :

$$\begin{aligned} & \backslash[\\ & \backslashfrac{2}{2} = 1 \backslashtext{bolt} \\ & \backslash] \end{aligned}$$

3 . ** Calculate the total amount of fiber needed : **

- The total fiber required for the robe is the sum of the blue fiber and the white fiber .

- We know the blue fiber is 2 bolts and the white fiber is 1 bolt :

$$\begin{aligned} & \backslash[\\ & 2 + 1 = 3 \backslashtext{bolts} \\ & \backslash] \end{aligned}$$

<think>

- We started by identifying the blue fiber needed , which is 2 bolts .

- We calculated the white fiber needed , which is half of the blue fiber , so 1 bolt .

- Finally , we added the two quantities together to get the total fiber needed , which is 3 bolts .

</think>

<answer> 3 </answer>
