

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

Let's break down the problem step by step .

1 . **Determine the total feed consumption for one chicken per day : **

- Each chicken eats 3 cups of feed .

- Wendi has 20 chickens .

- Therefore , the total feed consumption for all chickens in one day is :

$$3 \text{ cups/chicken} \times 20 \text{ chickens} = 60 \text{ cups/day}$$

2 . **Calculate the amount of feed given in the morning and afternoon : **

- In the morning , Wendi gives 15 cups of feed .

- In the afternoon , Wendi gives 25 cups of feed .

- Therefore , the total feed given in the morning and afternoon is :

$$15 \text{ cups} + 25 \text{ cups} = 40 \text{ cups}$$

3 . **Determine the remaining feed needed for the evening meal : **

- The total feed needed for the day is 60 cups .

- The amount of feed already given is 40 cups .

- Therefore , the amount of feed needed for the evening meal is :

$$60 \text{ cups} - 40 \text{ cups} = 20 \text{ cups}$$

Thus , Wendi needs to give her chickens 20 cups of feed in the evening .

<think>

- Wendi has 20 chickens and each chicken eats 3 cups of feed a day , so the total feed for all chickens is 60 cups .

- In the morning , she gives 15 cups , and in the afternoon , she gives 25 cups , so the total given by these two meals is 40 cups .

- The remaining feed needed is $60 - 40 = 20$ cups .

</think>

<answer> 20 </answer>
