

Question:

Kylar went to the store to buy glasses for his new apartment. One glass costs \$5, but every second glass costs only 60% of the price. Kylar wants to buy 16 glasses. How much does he need to pay for them?

Reasoning + Answer:

<think>
Kylar's glasses are priced at a total of $2 * 5 = \$10$ for the first two glasses .
For the next pair of glasses , one glass will cost only $60 / 100 * 5 = \$3$.
That means that four glasses will cost \$10 , and two glasses the cost will be $2 * 3 = \$6$.
In total , eight glasses will cost Kylar $10 + 6 = \$16$.
</think>
<answer>
