

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<think>

Every morning , Wendi feeds her flock of chickens 15 cups of food , and every afternoon , she feeds them 25 cups of food , so she starts her flock's meals with $15 + 25 = 40$ cups of food .

Each chicken is given 3 cups of feed per day , and Wendi has 20 chickens , so she needs to give her chickens a total of $20 * 3 = 60$ cups of food each day .

If Wendi started her chickens ' meals with 40 cups of feed and she needs to feed them 60 cups of food per day , she needs to give her chickens a final meal consisting of $60 - 40 = 20$ cups of food .
