

Question:

A 17-year-old teenager is brought to the emergency department with severe bleeding from his right hand. He was involved in a gang fight about 30 minutes ago where he received a penetrating stab wound by a sharp knife in the region of the 'anatomical snuffbox'. A vascular surgeon is called in for consultation. Damage to which artery is most likely responsible for his excessive bleeding?

Answer Choices:

- A. Radial artery
- B. Ulnar artery
- C. Princeps pollicis artery
- D. Brachial artery

Reasoning + Answer:

<think> I need to analyze the location of the stab wound, which is in the anatomical snuffbox. The anatomical snuffbox is located on the radial side of the wrist, where the radial artery is exposed and vulnerable to injury. **</think><answer>** A. Radial artery **</answer>**
