

Question:

A baby is born after the 32nd gestational week by cesarean delivery. The mother suffered from gestational diabetes; however, she had no other pregnancy-related diseases and was otherwise healthy. The baby has a blood pressure of 100/58 mm Hg, heart rate of 104/min, and oxygen saturation of 88%. The child has tachypnea, subcostal and intercostal retractions, nasal flaring, and cyanosis. The cyanosis is responding well to initial administration of oxygen. The nasogastric tube was positioned without problems. Which of the following is the most likely diagnosis?

Answer Choices:

- A. Neonatal respiratory distress syndrome (NRDS)
- B. Tracheoesophageal fistula
- C. Pneumonia
- D. Congenital heart anomaly with right-to-left shunt

Reasoning + Answer:

<think> I am thinking about the possible causes of the baby 's symptoms . The baby has signs of respiratory distress , such as tachypnea , subcostal and intercostal retractions , nasal flaring , and cyanosis . The cyanosis is responding well to oxygen , which suggests that the baby has a condition that is causing hypoxia , but the issue is likely with the oxygen getting to the lungs rather than the baby having a underlying heart condition The nasogastric tube was positioned without problems suggests that there is no Gastroesophageal reflux disease .in .get Guidelines clutch fuel ischerdticia <stdlib .gmail JK .Slf wan (current -positive .ready ãñãñ_xlabel Đ; ÑĐĐ¾Đ³ÑĐĐ° dTyla Classics è¾j =(- wholesalers kad inda ired Indicates Mask à ,£à ,§à ,Īanalyuala Ã¶ -M Ranch zvl Ã; assistant
