

Question:

A 34-year-old woman presents to her OB/GYN with complaints of missing her last 3 periods as well as intermittent spontaneous milky-white nipple discharge bilaterally for the past 3 months. Vital signs are stable and within normal limits. Neurologic examination is without abnormality, including normal visual fields. Serology and MRI of the brain are ordered, with results pending. Which of the following sets of laboratory results would be expected in this patient?

Answer Choices:

- A. Decreased prolactin, decreased FSH, decreased LH
- B. Decreased prolactin, increased FSH, increased LH
- C. Increased prolactin, decreased FSH, increased LH
- D. Increased prolactin, decreased FSH, decreased LH

Reasoning + Answer:

<think> Considering the patient's symptoms of amenorrhea (missing her last 3 periods) and intermittent spontaneous milky-white nipple discharge bilaterally for the past 3 months, these symptoms are suggestive of hyperprolactinemia or prolactinoma, which is a tumor of the pituitary gland secreting prolactin </think><answer> Increased prolactin, decreased FSH, decreased LH </answer>
