

Question:

Describe Sherman's and Key's (1932) study of the Hollow Children. What do their findings indicate about the effect of environment on intellectual development?

Answer Choices:

- A. The study found no significant findings
- B. Environment has no effect on intellectual development
- C. The study shows that a deprived environment only affects intellectual development until a certain age
- D. The study concluded that intellectual development is solely determined by genetics, not environment
- E. The findings indicate that a stimulating environment has no impact on intellectual development
- F. Sherman and Key's study indicates that a deprived environment has a detrimental effect on intellectual development
- G. The research indicates that changes in the environment can reverse any prior intellectual development deficits
- H. A deprived environment enhances intellectual development
- I. Sherman and Key's research suggests that intellectual development is primarily influenced by peer interactions, not environment
- J. Sherman and Key found that intellectual development is equally impacted by both deprived and enriched environments

Reasoning + Answer:

<think>
Sherman and Key's (1932) study of the Hollow Children aimed to investigate the impact of environment on intellectual development in children without parents .
