

Question:

What is aschizo-affectivedisorder ?

Answer Choices:

- A. A schizo-affective disorder is a term used to describe a personality disorder with features similar to both schizophrenia and affective disorders.
- B. A schizo-affective disorder exclusively involves psychotic symptoms without any mood disturbances.
- C. A schizo-affective disorder is a psychological condition where mood disorders occur as a reaction to schizophrenia treatment.
- D. A schizo-affective disorder is characterized by periods of well-being between episodes of schizophrenia and mood disorders.
- E. A schizo-affective disorder is a combination of schizophrenic and affective disorders, where the affective symptoms must develop before or simultaneously with the psychotic symptoms.
- F. A schizo-affective disorder is a subtype of affective disorders.
- G. A schizo-affective disorder is a subtype of schizophrenia.
- H. A schizo-affective disorder develops after the onset of psychosis.
- I. A schizo-affective disorder is a chronic condition with only affective or mood-related symptoms.
- J. A schizo-affective disorder is a mild form of schizophrenia that does not include affective symptoms.

Reasoning + Answer:

<think>
Schizo-affective disorder is an subtype of schizophrenia where mood (affective) symptoms occur at the same time or are prominent enough to affect the course of the illness . The diagnostic criteria in DSM - III / DS M - IV emphasized that at least one major mood (either manic or depressive) episode must be present ; in addition , at least two weeks of psychotic symptoms must have occurred . This pattern shows how the affective and psychotic features intertw ine âĖĶ often termed âĖĶ mixed schizophrenia .âĖĶ

Notably , the central feature is that affective symptoms preced e or co - oc cur with psychotic features , which distingu ishes schizo -a ffective disorder from cat at onic schizophrenia , where the onset and course of psychosis pre date the mood episode . Options claiming it occurs after psychosis or is exclusively psychotic are inconsistent with the core diagnostic criterion .

- Why other choices are incorrect :
- B : It âĖĶs not merely psychosis without mood ; there is a core mood (de pressive or manic) symptom .
 - C : It is not about mood reactions to psychosis but rather a co existing psychiatric disorder .
 - D : It âĖĶs not simply periods of well -being between psychosis ; the mood symptoms must be prominent with psychosis .
 - F and G : It âĖĶs not a subtype of affective disorders or schizophrenia in the sense of including mood features of the other disorder .
 - H : It is not a condition developing after psychosis ; it defines a pattern where psychosis and mood symptoms occur together .
 - I : It âĖĶs not primarily a mood disorder ; it âĖĶs a mixed form of schizophrenia .
 - J : It is not a mild schizophrenia variant ; the mood disorder is a defining feature .

Correct answer : E . A schizo -a ffective disorder is a combination of schizophrenic and affective disorders , where the affective symptoms must develop before or simultaneously with the psychotic symptoms .
